Assessment:

Write a vue.js front end and laravel backend application that allows me to track my time spent on freelance projects. The front end must allow me to add a new project for a client. Clicking on a project will allow me to add, update or delete a task.

When a task is selected or created it must then enable me to hit a record button that will start tracking time. When I hit the stop button it must stop the tracking.

A second report screen will give me a breakdown of how much time I have spent per project and client.

Your laravel application must include the database migration scripts to enable me to create the database.

https://laravel.com/docs/5.6/ for reference

Load the solution on github and share with me when done.
